Airborne mapping – big data for smart solutions

by Dr. Hartmut Rosengarten, Leica Geosystems

The volume of 3D information has drastically increased along with mature data acquisition technologies such as airborne camera and lidar systems. Now is the time to optimise workflows and solutions resulting into much more actionable information. The presentation gives an update on the complementary fleet of Leica’s airborne mapping workflows and output results. Major news includes Leica’s next generation of DMC III frame camera technology, the integrated 3D HexMap production environment and the recently-released bathymetric lidar solutions such as Chiroptera II and HawkEye.
